Plant-derived antimicrobial proteins are expressed in endosymbiotic clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFPI from R. sativus. The full-length CDNA sequence of PCR assisted site-directed mutagenesis of Rs-AFP2 is given in AAQ70130 and the deduced amino acid sequence in AAR57327. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                                                                                                                                                                                               This cDNA represents the sequence of Rs-APP2 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino caids 2 to 7 of Rs-APP1 and has a sense crientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and igoxigenin-11-dTPP instead of dTPP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII cDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript pagemid form with the aid of helper phage the chers between 250-300bp. The inserts of the 4 largest clones were then sequenced and found to differ only in the 1 largest clones were then sequenced and found to differ only in the langth of their 5' and 3' UTR's. The longest sequence was identified as Rs-APP1 so the Rs-APP2 was seen to differ by only 2 amino acids from nucleotide sequence by PCR assisted site directed mutagenesis. (Updated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          135
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       195

Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-APPI from R. sativus. The full-length cDNA sequence of Rs-APPI is given in AAQ70128. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This cDNA represents the sequence of Rs-APP1 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA 11bray. This primer corresponds to amino acids 2 to 7 of Rs-APP1 and has a sense crientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and ingoxigenin-11-dUTP instead of dTTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII cDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage (2 their size compared by agarcse gel electrophoresis. Four clones had insert sizes of approx. 400bp the others between 250-300bp. The inserts of the largest clones were then sequenced and found to differ only in the length of their 5, and 3, UTR's. The longest sequence is given here.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ATGGCTAAGTTTGCGTCCATCATCGCACTTCTTTTTGCTGCTCTTGTTCTTTTTTGCTGCT 75

  This cDNA sequence encodes an Rhapanus sativus (radish) antifungal protein, Rs-AFP12.
AAM19231, have also been produced (see AAM19282-92, AAM19294-98, AAM193301-04, AAM19330-34 and AAW11765-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease rolasistance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct plaids.)
                                                                                                                                                                                                                                                                                                                                                                                                         Antifungal protein; candida; fungal resistance; food additive; radish; crop protection; plant defensin; bacterial protection; preservative; ss.

Radish antifungal protein 1 (Rs-AFP1) cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rees SB;
```

rice blast disease against pathogenic microbes

```
This cDNA clone codes for the preprotein for radish antifungal protein 1 (RSA-FRP1) (ARAN1961). Novel antifungal proteins are based on RSA-FRP1, Rs-AFP2 (see AAW19616), Rs-AFP3 and Rs-AFP4, especially those in which Gly9 is repaced by Arg, Val39 by Arg, Gly9 by Arg, Glu5 by Met and/or Gly16 by Met. Mutants (see AAW36371-90) of Rs-AFP2 are specifically claimed. The mutants show improved salt tolerant antifungal activity, particularly when expressed in plants
                                                                                                                                                                                                                                                                                                                                                             Raphanus sativus antibacterial protein radishin encoding DNA SEQ ID NO:1.
                                                                                                                                                                                                                                                                                                   40
                                                                                                                                                                                                                                                                                                                                                                                                       SerGlyValCysGlyAsnAsnAsnAlaCysLysAsnGlnCysIleArgLeuGluLysAla 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated DNA from Raphanus sativus used to transform a microbe and a plant to produce an antibacterial protein used to increase resistance of rice paddy against pathogenic microbes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes an antibacterial protein, designated radishin, isolated from Raphanus sativus (radish). A phage or plasmid comprising radishin can be used for increasing resistance of paddy and

DOKU-) DOKURITSU GYOSEI HOJIN NOGYO SEIBUTSU SH

```
The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensing, the Dahlia antimicrobial protein (AMP) I and the antifungal protein 2 (RaAFP2), linked by a linker propertied of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprisaing a cleavage site, whereby the expressed polyprotein is post-translationally processed into the component protein molecules. The propertied sequences consisting of either two acidic, two basic or one acidic and one basic residue as a cleavable linker sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                         The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as disease, and leaf blight, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SerGlyValCysGlyAsnAsnAsnAlaCyslysAsnGlnCysIleArgLeuGluLysAla

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ArgHisGlySerCysAsnTyzValPheProAlaHisLysCysIleCysTyrPheProCys 80
                                                                                                                                                                                                                                                                                                                The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein acquences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.

                                                                                                                                                                    antimicrobial activity, useful
                                                                                                                                                                                                                                                             The invention comprises the amino acid and coding sequence of an antimicrobial protein obtained from Brassica sp. The DNA and protein sequences of the invention are useful in the production of a multiple disease resistant plant. The present cDNA sequence encodes the Brassica oleracea defensin protein.

The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Eutrema wasabi (Wasabia japonica) gamma-thionin protein from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  121 rcaggagrereregaaacaacaaregegegegagaarearegegereearegagagagaa 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 40
                                                                                                                                                                                                              Novel Brassica sp. derived protein having antimicrobial activity, useful for producing multiple disease resistant plants.
                                                                                                                                                                                                                                                                                      The invention comprises the amino acid and coding sequence of an antimicrobial protein obtained from Brassica sp. The DNA and protein sequences of the invention are useful in the production of a multiple disease resistant plant. The present DNA sequence encodes the Brassica antimicrobial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Wasabia japonica; gamma-thionin; plant; disease-resistant plant; gene;

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polymucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants. The method is useful in the production of transgenic plants end edged and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thalians stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

Site 1: Not! Site 2: Sal1; Seeds were collected by Dr.

Francois Ouellet when they were still very green (mid to large stage, cotyledons were formed). The seed coats were removed and the remaining tissue was used for cDNA library construction. mRNA was poly-A primed using SuperScript Plasmid System cDNA Synthesis and Cloning kit (Invitrogen) After initial screened out using 22 oligos designed to match napins (including albumins), cruciferins, oleosins, trypsin inhibitor 2, cytosolic GAPDH, cyclophilins, HSP70, desaturase, and CAB (LHCP)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EST 10-JUL-2003

Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFPI from R. sativus. The full-length cDNA sequence of Rs-AFPI is given in AAQ70128. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                This cDNA represents the sequence of Rs-AFP1 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and olosyigenin-11-dUTP instead of dTTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII CDNA library by in situ plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage (C their size compared by agarose gel electrophoresis. Four clones had inserts sizes of approx. 400bp the others between 250-300bp. The inserts of the 4 largest clones were then sequenced and found to differ only in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TCAGGAGTCTGTGGAAACAATAACGCATGCAAGAATCAGTGCATTAACCTTGAAAAGCA 195

This cDNA clone codes for the preprotein for radish antifungal protein 1 (Rs-AFP1) (AAW19617). Novel antifungal proteins are based on Rs-AFP1, Rs-AFP2 (see AAW19615), Rs-AFP3 and Rs-AFP4, especially those in which Gly9 is repaced by Arg, Vsl) by Arg, Gly9 by Arg, Glu5 by Met and/or Gly16 by Met. Mutants (see AAW12371-90) of Rs- AFP2 are specifically claimed. The mutants show improved salt tolerant antifungal activity, particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of the 4 largest clones were then sequenced and found to differ only in the length of their 5' and 3' UTR's. The longest sequence was identified as Rs-AFP1 (AAQ38650). Rs-AFP2 was seen to differ by only 2 amino acids from Rs-AFP1, so the Rs-AFP1 cDNA was transformed to the Rs-AFP2 nucleotide sequence by PCR assisted site directed mutagenesis. (Updated on 25-WAR-2003 to correct PN field.)

PCR screening a Raphanus sativus ded together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and digoxigenin-11-dTPP instead of dTTP to give a digoxigenin-11-dTPP instead of dTTP to give a digoxigenin-13-dTPP instead of dTTP to give a digoxigenin labeled PCR product. This was used to screen a lambda ZAPII cDNA library by in situ plaque were principled and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage the AROB-Inserts from 22 postitive clones were excised by Economack by agarces gel electrophoresis. Four clones had insert sizes of approx. 400bp the others between 250-300bp. The inserts

Plant-derived antimicrobial proteins are expressed in endosymbiotic clavibacter xyll subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length CDNA sequence of PCR assisted site-directed mutagenesis of Rs-AFP2 is given in AAQ70130 and the deduced amino acid sequence in AAR57327. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 CTCGAAGCACCAACAATGGTGGAAGCACAGAAGTTGTGCGAGAGGCCAAGTGGACATGG

                 Novel Brassica sp. derived protein having antimicrobial activity, useful for producing multiple disease resistant plants.
                                                             The invention comprises the amino acid and coding sequence of an antimicrobial protein obtained from Brassica sp. The DNA and protein sequences of the invention are useful in the production of a multiple disease resistant plant. The present cDNA sequence encodes the Brassica oleracea defensin protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          80
                                                                                                                                                                                                     The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease restance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.

protein expression; plant defensin; RsAFP2; antifungal protein; AFP2; ss.
                 Isolated DNA from Raphanus sativus used to transform a microbe and a plant to produce an antibacterial protein used to increase resistance of rice paddy against pathogenic microbes.
                                                                                                              The present sequence encodes an antibacterial protein, designated radishin, isolated from Raphanus sativus (radishi). A phage or plasmid comprising radishin can be used for increasing resistance of paddy and rice blast disease against pathogenic microbes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21 PheGluAlaProThrMetValGluAlaGlnLysLeuCysGluArgProSerGlyThrTrp

                                                                                                             Novel Brassica sp. derived protein having antimicrobial activity, useful for producing multiple disease resistant plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SerGlyValCysGlyAsnAsnAsnAlaCysLysAsnGlnCysIleAsnLeuGluLysAla 60
                                                                                                                                                                                              The invention comprises the amino acid and coding sequence of an antimicrobial protein obtained from Brassica sp. The DNA and protein sequences of the invention are useful in the production of a multiple disease resistant plant. The present DNA sequence encodes the Brassica antimicrobial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ATGCCAAGTTTGTGTCTATCATTGCCCCACTTTTTGCTGCTCTTGTTTTAGCTGCT

                                                                                                                 The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMP) I and the antifungal protein 2 (RBAFP2), linked by a linker propeptide of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is post-translationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, V, S and T and contains dipeptidic sequences consisting of either two acidic, two basic or one considic and one basic residue as a cleavable linker sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                503
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 563

The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Eutrema wasabi (Wasabia japonica) gamma-thionin protein from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 TTTGAAGCACCATCAATGGTGGAAGCGCAGAAGTTGTGCGAGAAAGTCAAGTGGGACATGG 120

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polymucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arrabidopsia thallana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             21 PheGluAlaProThrMetValGluAlaGlnLysLeuCysGluArgProSerGlyThrTrp

(modified: GCGCCGCC-GACTAGTGACCTC-eggacgcgtgGTCGAC);
Site 1: Not1; Site 2: Sal1; Seeds were collected by Dr.
Francois Ouellet when they were still very green (mid to large stage, cotyledons were formed). The seed coats were removed and the remaining tissue was used for cDNA library construction. mRNA was poly-A primed using SuperScript Plasmid System cDNA Synthesis and Cloning kit (Invitrogen) After initial screening, the most abundant redundant clones were screened out using 22 oligos designed to match napins (including albumins). cruciferins, oleosins, HSP70, desaturase, and CAB (LHCP)."
